DETAILS

When you have captured your photograph along with the details that make up those photos, you need to create two complete "Scenes". You will do this by creating a blank image, then cropping and copying the pieces onto your blank image.

Step 1: Download your images into a "details" folder. Create a contact sheet and save is as a JPG to show all of your work.

Step 2: Creating the Scenes

- Create a blank document, size 8 in by 10 in, 150 resolution (or 10 x 8).
- Open the main image, the photo that shows the entire scene. Crop this photo to 6 in wide by 4 in tall (or 4 x 6). Copy the image and past it into the center of your blank document. Rename this layer "main." You should have two layers now. You should also save now – call it **details 1** or **details 2**
- Now you need to place the smaller "detail" images on the new document. Since they are smaller, crop them at 1.5 in wide and 2 in tall (or 2 x 1.5). Paste them into the details document and rename the layers something appropriate like "light," "handle," etc. Arrange these layers in their proper spots around the main image.
- You can create an outline or shadow for these layers by clicking on the correct layer in the Layers Palette, then use the Layers menu to go to Layer Styles>Stroke or Layer Styles>Drop Shadow.
- The next step is to outline the places on the main image that define where the "details" are. Start by drawing a rectangle with the Marquee tool. Go to the Select menu and drag down to Modify>Border. Use 2-3 pixels, and the border will expand. Go to the Edit menu and select Fill... choose either black, white, or another color that will stand out against your background.
- The final step is to draw a line from the details to your newly created boxes on the main image. Do this with the Line tool underneath the Rectangle tool. You will need to create a new layer: Layers menu> New> Layer.

Examples – the left images uses stroke around the details while the right uses a drop shadow.
